## Security Camera for Trioliet mixer feeders

Agriculture is always in motion. Today, more work is being done with big machines like tractors, mixer feeders, feeding and milking robots. Obviously, these developments are focused on efficiency, but the ever-growing and modern equipment also brings risks. Numbers of accidents on farms are increasing. For example in the Netherlands children that live on farms are admitted to the hospital twice as often as urban children. And every year five young people die due to an accident on the farm. Trioliet is aware of the security risks, and introduces a camera system for their mixer feeders.

The camera can be rotated 360 degrees and has been specially developed for agricultural purposes. It can withstand temperatures from -40°C to +85°C, and the housing is suitable for cleaning with a pressure cleaner. The lens is automatically heated; therefore the view is always optimal even in cold- and wet circumstances. The image of 7" color monitor has a split screen, so that the images from different cameras can be displayed simultaneously.

The camera is suitable for all Trioliet mixer feeders. The ¼ inch camera is placed in the centre at the backside, but can also be mounted at other positions. A total of up to four cameras can be connected in a system. The rule is: more cameras, more visibility and more security. How many cameras should be mounted, is naturally very farm specific. The farmer knows the risks to its situation the best.

The camera can be installed on new machines, but also can be installed as retrofit on the current Trioliet machine.
